SPARE PARTS TO BE PRODUCED IN BULGARIA -- Sofia, Rabotnichesko
Delo, 18 October 1951

As a result of constant work on the part of the Party and the people's government during 1950 and 1951, assembly-line production of spare parts for automobiles, farm machinery, industrial machinery was started in many enterprises and plants in Bulgaria. The workers at the spare parts enterprises and plants mastered the technique of producing a number of different kinds of spare parts in a very short time. The number of different kinds of spare parts is already over 20,000.

The "Anton Ivanov" Plant is producing cast-iron pistons for all kinds of tractors and piston pins for all kinds of motor vehicles. The "Georgi Dimitrov" State Industrial Enterprise is producing spare parts for reapers, row-planting machines, threshing machines, tractors, combines, cultivators, binders, etc.

This year, for the first time in our country, the production of nozzles and parts for oil pumps, very much needed by the national economy, was begun.

The production of spare parts in 1949 was 200 percent of the 1948 production, and in 1950 it was 400 percent, while during the current year it has risen to ten times the 1948 production.

The quality of spare parts produced is constantly improving. The coronas 7 and pinions for automobile engines produced in Bulgaria can be used for more than 20,000 kilometers without showing any defect.

The workers in our plants are working with might and
